ABSTRACT

IMAGE PROCESSING SYSTEM

5        This invention relates to an image processing system for  
capturing images from an event and for distributing images so  
obtained to one or more clients. The system may comprise a  
terminal associated with a camera and a first editing  
facility, wherein the terminal is configured to receive a  
10 master image file corresponding to an image of the event  
captured by the camera to store the master image file, to  
create a preview image file of a smaller file size, and to  
transmit the preview image file to the first editing facility,  
and wherein the first editing facility is configured to  
15 transmit a preview image file to a client.
